### n-Track Studio 3.0 adds support for WDM drivers

The latest version of n-Track Studio adds support for WDM soundcard device drivers

WDM device drivers, currently available for most of today's soundcards, allow recording and playback with latencies much lower than with MME, the older Windows driver standard. Unlike most of existing recording software that access WDM drivers through a Windows MME emulation layer that adds latency, n-Track Studio accesses the WDM drivers directly and thus allows for very low latencies. Being WDM the new Windows standard driver format WDM drivers are readily available for many soundcards and unlike Asio drivers no specific implementation of the driver needs to be written for the soundcard to work with very low latencies.

Such small latencies, up to a few milliseconds, make practical to play an instrument live with the program's live input processing feature. For example it's possible to connect a guitar to a soundcard input, add a distortion plug-in and record guitar tracks hearing the sound through the computers speakers. This setup eliminates the need for guitar amplifiers or direct boxes. It's also possible to play MIDI instruments live through VST or DirectX instruments soft synths.

Other enhancements of the latest version of the program include support for automation of DirectX and VST effects parameters during playback, support for the new DirectX Instruments plug-in standard, enhanced MIDI editing.

n-Track Studio 3.0 is a multitrack recording and editing software for Windows 95/98/ME/NT/2000/XP: it allows recording, mixing and editing of a virtually unlimited number of audio and MIDI tracks. The program's ease of use makes it perfect for small studios and for music hobbyists who want to record their own music.

n-Track Studio 3.0 for Windows costs 42\$ and 64\$ (24 bit soundcards version). For more information, visit the program's web site (<http://www.ntrack.com>) or contact the author of the program, Flavio Antonioli, via G. Viotti 10, 00124 Rome, Italy.
